

CSE 511: Data Processing at Scale

Amey Bhilegaonkar

Arizona State University
abhilega@asu.edu

Introduction

This project involves creating a highly scalable and available data processing pipeline using Kubernetes and Kafka, integrated with Docker and Neo4j. The pipeline will ingest streaming data produced by Kafka stream and perform processing operations on it and then distribute it to Neo4j for near real-time processing and analytics. This project involved stepwise execution wherein the first step involved setting up the Kafka and Apache Zookeeper together using the orchestrator minikube, which is a lightweight Kubernetes implementation that runs locally on your machine. Kafka will be used to ingest data from the parquet file and distribute it to other components of the pipeline. In the second step, integration of Neo4j into the setup is performed, and the data is streamed into Neo4j for further analysis and processing. Once the data is ingested into Neo4j, the analysis and algorithms such as PageRank and BFS were applied to graph-based data to explore the data.

Methodology

The aim of this section is to propose a methodology for implementing Kafka and Neo4j as a service using Helm and Minikube in Kubernetes. The proposed methodology consists of the following steps:

1.1. Environment Setup

The first step in installing Kafka and Neo4j as a service is to create the proper environment. The installation of Minikube, Kubernetes, and Helm is the first step towards putting the Kafka and Neo4j services into practice. A local Kubernetes cluster called Minikube offers the essential conditions for setting up and running the services. Helm, on the other hand, is a Kubernetes package manager that streamlines the cluster's application administration and installation processes.

1.2 Kafka and Zookeeper Installation: This can be achieved by creating a Kafka cluster and Zookeeper on Kubernetes. The two YAML files `kafka-setup.yaml` and `zookeeper-setup.yaml` contain the necessary configurations required for a basic Kafka cluster to get up and running.

1.3 Neo4j Installation: This step involves storing the data in Neo4j. For this purpose, an official Neo4j Helm chart can be utilized to create a Neo4j cluster. The `neo4j-values.yaml` and `neo4j-service.yaml` will help us get the Neo4j service up and running to serve as a backend database.

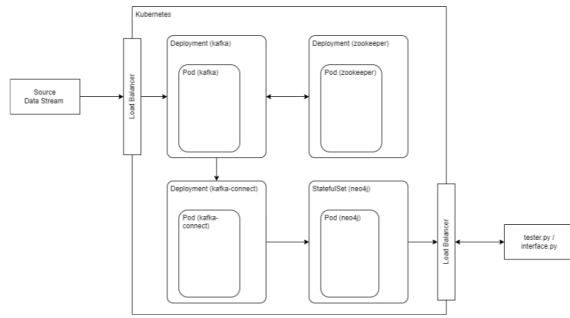

1.4 Data Ingestion: After the Kafka cluster is up and running, the next step is to ingest data into the Kafka cluster. For this step, we will run a `data_producer.py` file which will load the graph data from the parquet file to Kafka and then to Neo4j.

1.5 Testing and Deployment: In the end, thorough testing is required to guarantee the implementation's appropriate functionality. Simple tests like sending a message via Kafka-stream and receiving it on the other end should be included in the testing process. Also, when the data is loaded with `data_producer.py` into a graph database, we can run `tester.py` along with `interface.py` from phase 1 of this project to see if BFS and PageRank algorithms are working fine. When testing is successfully finished, the implementation can be reliably put into use.

1.6 Testing on limited resources: For testing purposes, since I had limited Memory and Cores for my personal laptop, it was really hard for me to run the original parquet file, it took almost a day for me just to run that file and still it was running the next day. So I decided to divide the whole file into chunks of 50 records and then test my code with 3 chunked files of 150 records. I modified the `tester.py` file, added my own test cases, and tested them. The part-parquet files and `tester.py` file is attached with the code. Also, screenshots from the results are attached to this report and the rest screenshots are pushed on [GitHub](#). Also, the Python file with which I created chunk files was also pushed to GitHub.

With the steps followed as described above, and with automation test cases created on my own, I learned new things and explored various resources to debug the issue which gave me exposure to various other extensions that are used to manage minikube and help it automate it.

Results

Architecture of services

After the successful deployment of pods of Zookeeper, Kafka, Kafka-connector, and Neo4j we should see the following results with the commands to test our flow from point A to point B.

The following Commands were run to check if our deployments are correct:

1. `kubectl apply -f ./zookeeper-setup.yaml`
2. `kubectl apply -f ./kafka-setup.yaml`
3. `helm install my-neo4j-release neo4j/neo4j -f neo4j-values.yaml`
4. `kubectl apply -f neo4j-service.yaml`
5. `kubectl apply -f Kafka-neo4j-connector.yaml`
6. `kubectl port-forward svc/neo4j-service 7474:7474 7687:7687`
7. `kubectl port-forward svc/Kafka-service 9092:9092`

Testing Commands:

1. `kubectl get pods`
2. `kubectl get services`
3. `python3 data_producer.py`
4. `python3 tester.py`

Kubernetes Deployments

211/2212/2213/2214/2215/2216/2217/2218/2219/2220/2221/2222/2223/2224/2225/2226/2227/2228/2229/2230/2231/2232/2233/2234/2235/2236/2237/2238/2239/2240/2241/2242/2243/2244/2245/2246/2247/2248/2249/2250/2251/2252/2253/2254/2255/2256/2257/2258/2259/2260/2261/2262/2263/2264/2265/2266/2267/2268/2269/2270/2271/2272/2273/2274/2275/2276/2277/2278/2279/2280/2281/2282/2283/2284/2285/2286/2287/2288/2289/2290/2291/2292/2293/2294/2295/2296/2297/2298/2299/2300/2301/2302/2303/2304/2305/2306/2307/2308/2309/2310/2311/2312/2313/2314/2315/2316/2317/2318/2319/2320/2321/2322/2323/2324/2325/2326/2327/2328/2329/2330/2331/2332/2333/2334/2335/2336/2337/2338/2339/2340/2341/2342/2343/2344/2345/2346/2347/2348/2349/2350/2351/2352/2353/2354/2355/2356/2357/2358/2359/2360/2361/2362/2363/2364/2365/2366/2367/2368/2369/2370/2371/2372/2373/2374/2375/2376/2377/2378/2379/2380/2381/2382/2383/2384/2385/2386/2387/2388/2389/2390/2391/2392/2393/2394/2395/2396/2397/2398/2399/2400/2401/2402/2403/2404/2405/2406/2407/2408/2409/2410/2411/2412/2413/2414/2415/2416/2417/2418/2419/2420/2421/2422/2423/2424/2425/2426/2427/2428/2429/2430/2431/2432/2433/2434/2435/2436/2437/2438/2439/2440/2441/2442/2443/2444/2445/2446/2447/2448/2449/2450/2451/2452/2453/2454/2455/2456/2457/2458/2459/2460/2461/2462/2463/2464/2465/2466/2467/2468/2469/2470/2471/2472/2473/2474/2475/2476/2477/2478/2479/2480/2481/2482/2483/2484/2485/2486/2487/2488/2489/2490/2491/2492/2493/2494/2495/2496/2497/2498/2499/2500/2501/2502/2503/2504/2505/2506/2507/2508/2509/2510/2511/2512/2513/2514/2515/2516/2517/2518/2519/2520/2521/2522/2523/2524/2525/2526/2527/2528/2529/2530/2531/2532/2533/2534/2535/2536/2537/2538/2539/2540/2541/2542/2543/2544/2545/2546/2547/2548/2549/2550/2551/2552/2553/2554/2555/2556/2557/2558/2559/2560/2561/2562/2563/2564/2565/2566/2567/2568/2569/2570/2571/2572/2573/2574/2575/2576/2577/2578/2579/2580/2581/2582/2583/2584/2585/2586/2587/2588/2589/2590/2591/2592/2593/2594/2595/2596/2597/2598/2599/2600/2601/2602/2603/2604/2605/2606/2607/2608/2609/2610/2611/2612/2613/2614/2615/2616/2617/2618/2619/2620/2621/2622/2623/2624/2625/2626/2627/2628/2629/2630/2631/2632/2633/2634/2635/2636/2637/2638/2639/2640/2641/2642/2643/2644/2645/2646/2647/2648/2649/2650/2651/2652/2653/2654/2655/2656/2657/2658/2659/2660/2661/2662/2663/2664/2665/2666/2667/2668/2669/2670/2671/2672/2673/2674/2675/267		

my own test cases, the corresponding tester.py file is submitted along with the other codes [here](#).

Discussion

This project involved a lot of learning for me and the curve was definitely exponential. I got to learn about Kubernetes, and how the applications are scaled and managed by the orchestration tools such as Kubernetes. Kubernetes plays an important role in scaling applications. I got to learn how streaming applications work together with services like Kafka, which is used to build real-time data pipelines and streaming applications. In simple terms, it is a tool that allows you to send and receive large volumes of data between different systems or applications in real time.

I liked one thing about this project: everything was pointed in a direction in which we could step and then gather information on our own, and apply that knowledge here to build scalable containerized applications, nothing was spoon-fed. Because of this, I got to explore technologies that I was not aware of, starting from Docker, Neo4j, Kafka, Kubernetes, Minikube, etc.

I think, for me, future work on this project will be significantly important, to take this project to AWS, a concept introduced in the class, and I would really like to explore that option as well. I will get to learn and explore AWS services, and how everything works in integration with one another in a cloud-based environment.

Overall, this project gave me insights into different technologies and services used for streaming jobs in real life, with a high learning curve.

Conclusion

In conclusion, I learned how data flows in real-time/near real-time from point A which is the inbound source systems of the job to point B which is the sink or database. I learned about the importance of message/streaming services such as Kafka, I also explored similar services in cloud platforms such as SQS. I also learned much about Neo4j, a graph database management system. Overall after doing this project, I gained insights into how an application is deployed to servers to make it work with different services running and communicating through containerized deployments.
