Execution Steps:

- Go to project root folder "Spatial-UDF".
- Build the project.
- Run the Entrance.scala file present in src->main->scala folder.
- If two files are same, The message "No difference in the files found!" on terminal means that output of the UDF matches the expected output.
- The input dataset is inside the data->inputs folder, in csv format.
- The output of UDF is stored in data->outputs folder, in txt format.
- The output of inbuilt function from postGIS is stored in data->true-outputs folder, in txt format.
- Note: Part files are merged by python script and compared with each other. The two files are exactly the same, but the order of the lines in the files maybe jumbled because of the part files, hence we are merging files with script and sorting them.
